ENGINE NUMBER: - First Number - 55,000. Stamped on left side of cylinder block opposite #8 cylinder.

ENGINE: - Own. Eight cylinder, In line, 'L' head type. Bore - 3". Stroke - 4-1/2".

Piston Displacement - 254.47 cubic Inches.

Developed Horsepower, Compression Ratio & Pressures-To Rated Horsepower - 28.8.

Piston: - Own Lo Ex, silicon-aluminum alloy, 'T' slot, cam ground type. Use finished replacement pistons when reconditioning engine. See reconditioning paragraph.

NOTE: - Use standard or oversize rings of size indicated for replacement pistons (see Replacement Piston section above); 3.000" - B, D, F; 3.003" - J; 3.005" - L; 3.010" - BO, DO, FO; 3.015" - LO; 3.020" - BB, DD, FF. If rings are filed, clearance at pin must be kept uniform with end gap.

Connecting Rod: - Weight 28.96 ounces. Length 8-3/16".
Lower Bearing - Spun-babbitt lined type.
Crankpin Journal Diameter - 1-15/16".
Clearance - .001". Sideplay, .006-.010".
Adjustment - Laminated shims. Do not file caps.

Installing Rods: - Connecting rod lower bearings offset. Install rods with right hand offset (widest half of bearing toward rear) in cylinders #1, 3, 5, 7 and rods with left hand offset (widest half forward in front) in cylinders #2, 4, 6, 8.

Crankshaft: - Five bearings. Eight counterweights.
Joumal Diameters - #1, 2-9/32"; #2, 2-5/16"; #31 2-11/32"; #4, 2-5/8"; #5, 2-13/32".
Bearing Type - Removable bronze-backed, babbitt-lined.
Clearance - .001".
Adjustment - Laminated shims. Do not file caps.
End Thrust - Taken by #3 center bearing. Endplay, .006-.012".

End Thrust - Taken by spring-loaded plunger in camshaft gear and thrust plate on gear cover.
Camshaft Setting - Gears are marked. Mesh marked tooth on crankshaft gear between two marked teeth on camshaft gear.

Valves: -

NOTE: - 1935 pistons may be installed in 1934 engines as complete sets only.

Reconditioning Cylinders: - Size of original bore indicated by letter stamped on lower edge of valve chamber opposite cylinder as follows: A - .3.000", B - 3.0005", C - .3.001", D - 3.0015", E - 3.002", AO - 3.010", BO - 3.0105", CO - .3.001", DO - .3.0115", EO - .3.012". Recondition cylinder to standard oversize for which replacement piston and rings are available (see piston and ring data below).

Fitting New Pistons: - Use feeler stock .0015-.002' thick to check clearance. It should be possible to withdraw feeler from between piston and cylinder bore on side opposite slot when grasped between thumb and forefinger with 3-4 lbs. pull.

Installing Pistons: - Slot should be to left or away from valves.

Piston Rings: - Four rings per pistons, two compression, two oil control rings (all rings above pin). Lower ring groove drilled radially with oil drain holes. Rings are positioned by pin in piston ring groove.

1935 Piston Rings

- 1 -
Lubrication (Cont'd)

- Oil pump mounted on right side of crankcase
- Normal Oil Pressure - 3 lbs.
- Oil Pressure Relief Valve - Operates at 3 lbs. Located on right hand side of crankcase at rear (combined with oil pressure signal light switch).
- Capacity and Oil - 7 quarts (refill), 9 quarts (dry). Use SAE. #30 (above 40º F.), #20-W (40º to 0º F.), #10-W (0º to -15º F.).

CLUTCH

- Own make. Single plate type operating in oil. No adjustment for wear required.
- Clutch Pedal Adjustment - Free movement of clutch pedal must be 1-1/2". To adjust, loosen lock nut on clutch pedal connecting link, remove clevis pin at lower end of link, turn clevis until free movement of pedal is 1-1/2", replace pin and tighten lock nut. See adjustment for automatic clutch linkage below.
- Automatic Clutch Control - On cars with automatic clutch, check control linkage whenever clutch pedal is adjusted. Depress accelerator pedal, pull back on clutch control unit cable (left side of engine), check clearance between back of slot in cable yoke and clevis pin which attaches it to operating lever. This clearance should be 7/8".
- Clutch Lubrication - Oil in clutch should be drained and replaced at 5000-15000 mile intervals. To drain oil, turn flywheel until filler plug is visible in inspection hole (left hand front face of flywheel above starter), remove plug, turn flywheel until star stamped on flywheel face is visible in inspection hole, allow at least 1 minute in this position for draining, turn flywheel until filler plug is visible, insert 1/3 pint Hudsonite Clutch Compound, replace filler plug.

Clutch (Cont'd)

- Clutch Facings - Driven plate is 6-3/8" I.D., 9-3/4" O.D., .203" thick. Facing consists of 108 cork inserts mounted on driven plate.

STEERING

- Front Suspension - Conventional 'I' beam section front axle with Elliott type ends and semi-elliptic springs, or Axleflex articulated axle. Data and adjustment for both types are the same.
- Kingpin Inclination - 7º crosswise.
- Caster - 4-4-1/2º. Adjusted by inserting wedge shims between springs and spring pad on axle.
- Camber - 1-1-1/2º. No adjustment, Axle may be bent cold to correct camber.
- Toe In - 1/8” measured 10” from ground. Adjust by loosening tie rod end clamp bolts and rotating tie rod.

NOTE - End thrust on kingpin Is taken by five ball bearings in plug above kingpin. Bearing lower race is machined directly in kingpin end.

Steering Gear: - Gemmer Worm-and-Sector type.

BRAKES

- Service - Bendix mechanical, Duo - Servo, Single anchor type. Hand lever applies all service brakes.
- Drum Diameter - 11”.
- Lining - Moulded type. Width 1-3/4”. Thickness 3/16”.
- Length per wheel 23-13/16”.
- Clearance -.014” heel, .008” toe, for each shoe.
- Hand Brake Adjustment - See Service Brakes.
